Convolutional neural network layers

In this notebook, we will build the convolutional neural network layers. This will be followed by a spatial batchnorm, and then in the final notebook of this assignment, we will train a CNN to further improve the validation accuracy on CIFAR-10.

```
In [2]: ## Import and setups
        import time
        import numpy as np
        import matplotlib.pyplot as plt
        from nndl.conv layers import *
        from utils.data_utils import get_CIFAR10_data
        from utils.gradient_check import eval_numerical_gradient, eval_numerical_gradient
        from utils.solver import Solver
        %matplotlib inline
        plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
        plt.rcParams['image.interpolation'] = 'nearest'
        plt.rcParams['image.cmap'] = 'gray'
        # for auto-reloading external modules
        # see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipytl
        %load ext autoreload
        %autoreload 2
        def rel error(x, y):
          """ returns relative error """
          return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

The autoreload extension is already loaded. To reload it, use: %reload_ext autoreload

Implementing CNN layers

Just as we implemented modular layers for fully connected networks, batch normalization, and dropout, we'll want to implement modular layers for convolutional neural networks. These layers are in nndl/conv_layers.py.

Convolutional forward pass

Begin by implementing a naive version of the forward pass of the CNN that uses for loops. This function is <code>conv_forward_naive</code> in <code>nndl/conv_layers.py</code>. Don't worry about efficiency of implementation. Later on, we provide a fast implementation of these layers. This version ought to test your understanding of convolution. In our implementation, there is a triple for loop.

After you implement conv_forward_naive, test your implementation by running the cell below.

```
In [18]: x_{shape} = (2, 3, 4, 4)
         w_{shape} = (3, 3, 4, 4)
         x = np.linspace(-0.1, 0.5, num=np.prod(x_shape)).reshape(x_shape)
         w = np.linspace(-0.2, 0.3, num=np.prod(w shape)).reshape(w shape)
         b = np.linspace(-0.1, 0.2, num=3)
         conv param = {'stride': 2, 'pad': 1}
         out, _ = conv_forward_naive(x, w, b, conv_param)
         correct_out = np.array([[[[-0.08759809, -0.10987781],
                                    [-0.18387192, -0.2109216]],
                                    [[ 0.21027089, 0.21661097],
                                    [ 0.22847626, 0.23004637]],
                                    [[ 0.50813986, 0.54309974],
                                    [ 0.64082444, 0.67101435]]],
                                  [[-0.98053589, -1.03143541],
                                    [-1.19128892, -1.24695841]],
                                    [[ 0.69108355, 0.66880383],
                                    [ 0.59480972, 0.56776003]],
                                    [[ 2.36270298, 2.36904306],
                                    [ 2.38090835, 2.38247847]]]])
         # Compare your output to ours; difference should be around 1e-8
         print('Testing conv forward naive')
         print('difference: ', rel_error(out, correct out))
```

Testing conv_forward_naive difference: 2.2121476417505994e-08

Convolutional backward pass

Now, implement a naive version of the backward pass of the CNN. The function is conv_backward_naive in nndl/conv_layers.py . Don't worry about efficiency of implementation. Later on, we provide a fast implementation of these layers. This version ought to test your understanding of convolution. In our implementation, there is a quadruple for loop.

After you implement conv_backward_naive, test your implementation by running the cell below.

```
In [34]: x = np.random.randn(4, 3, 5, 5)
                                 w = np.random.randn(2, 3, 3, 3)
                                  b = np.random.randn(2,)
                                  dout = np.random.randn(4, 2, 5, 5)
                                  conv_param = {'stride': 1, 'pad': 1}
                                  out, cache = conv_forward_naive(x,w,b,conv_param)
                                  dx_num = eval_numerical_gradient_array(lambda x: conv_forward_naive(x, w, b, c
                                  dw_num = eval_numerical_gradient_array(lambda w: conv_forward_naive(x, w, b, conv
                                  db_num = eval_numerical_gradient_array(lambda b: conv_forward_naive(x, w, b, c
                                  out, cache = conv_forward_naive(x, w, b, conv_param)
                                  dx, dw, db = conv_backward_naive(dout, cache)
                                  # Your errors should be around 1e-9'
                                  print('Testing conv_backward_naive function')
                                  print('dx error: ', rel_error(dx, dx_num))
                                 print('dw error: ', rel_error(dw, dw_num))
                                  print('db error: ', rel_error(db, db_num))
```

Max pool forward pass

In this section, we will implement the forward pass of the max pool. The function is max_pool_forward_naive in nndl/conv_layers.py . Do not worry about the efficiency of implementation.

After you implement <code>max_pool_forward_naive</code> , test your implementation by running the cell below.

```
In [25]: x shape = (2, 3, 4, 4)
         x = np.linspace(-0.3, 0.4, num=np.prod(x_shape)).reshape(x_shape)
         pool param = {'pool_width': 2, 'pool_height': 2, 'stride': 2}
         out, _ = max_pool_forward_naive(x, pool_param)
         correct_out = np.array([[[[-0.26315789, -0.24842105],
                                   [-0.20421053, -0.18947368]],
                                  [[-0.14526316, -0.13052632],
                                   [-0.08631579, -0.07157895]],
                                  [[-0.02736842, -0.01263158],
                                   [ 0.03157895, 0.04631579]]],
                                 [[[ 0.09052632, 0.10526316],
                                   [ 0.14947368, 0.16421053]],
                                  [[ 0.20842105, 0.22315789],
                                   [ 0.26736842, 0.28210526]],
                                  [[ 0.32631579, 0.34105263],
                                   [ 0.38526316, 0.4
                                                             1111)
         # Compare your output with ours. Difference should be around 1e-8.
         print('Testing max pool forward naive function:')
         print('difference: ', rel_error(out, correct_out))
```

Max pool backward pass

In this section, you will implement the backward pass of the max pool. The function is max_pool_backward_naive in nndl/conv_layers.py . Do not worry about the efficiency of implementation.

After you implement <code>max_pool_backward_naive</code> , test your implementation by running the cell below.

Testing max_pool_backward_naive function: dx error: 3.2756404066242766e-12

Fast implementation of the CNN layers

Implementing fast versions of the CNN layers can be difficult. We will provide you with the fast layers implemented by utils. They are provided in utils/fast_layers.py.

The fast convolution implementation depends on a Cython extension ('pip install Cython' to your virtual environment); to compile it you need to run the following from the utils directory:

```
python setup.py build_ext --inplace
```

NOTE: The fast implementation for pooling will only perform optimally if the pooling regions are non-overlapping and tile the input. If these conditions are not met then the fast pooling implementation will not be much faster than the naive implementation.

You can compare the performance of the naive and fast versions of these layers by running the cell below.

You should see pretty drastic speedups in the implementation of these layers. On our machine, the forward pass speeds up by 17x and the backward pass speeds up by 840x. Of course, these numbers will vary from machine to machine, as well as on your precise implementation of the naive layers.

```
In [52]: from utils.fast layers import conv forward fast, conv backward fast
         from time import time
         x = np.random.randn(100, 3, 31, 31)
         w = np.random.randn(25, 3, 3, 3)
         b = np.random.randn(25,)
         dout = np.random.randn(100, 25, 16, 16)
         conv param = {'stride': 2, 'pad': 1}
         t0 = time()
         out_naive, cache_naive = conv_forward_naive(x, w, b, conv_param)
         t1 = time()
         out_fast, cache_fast = conv_forward_fast(x, w, b, conv_param)
         t2 = time()

db error: 4.4103318571540694e-11

What next?

We saw how helpful batch normalization was for training FC nets. In the next notebook, we'll implement a batch normalization for convolutional neural networks, and then finish off by implementing a CNN to improve our validation accuracy on CIFAR-10.
